V-belts

V-belts for Industry

From one of the world's major experts in the rubber sector, a new range of V-belts at the highest performance and reliability levels for power transmission are now available.

HIFLEX V-belts are manufactured with premium rubber compounds and have high tensile strength, low stretch polyester reinforcing cords. They are available in the classical type (sections Z (M), A, B, C, D, E) and Narrow/Wedge type (sections SPZ, SPA, SPB, SPC), as well as in the Raw Edge Cogged type.

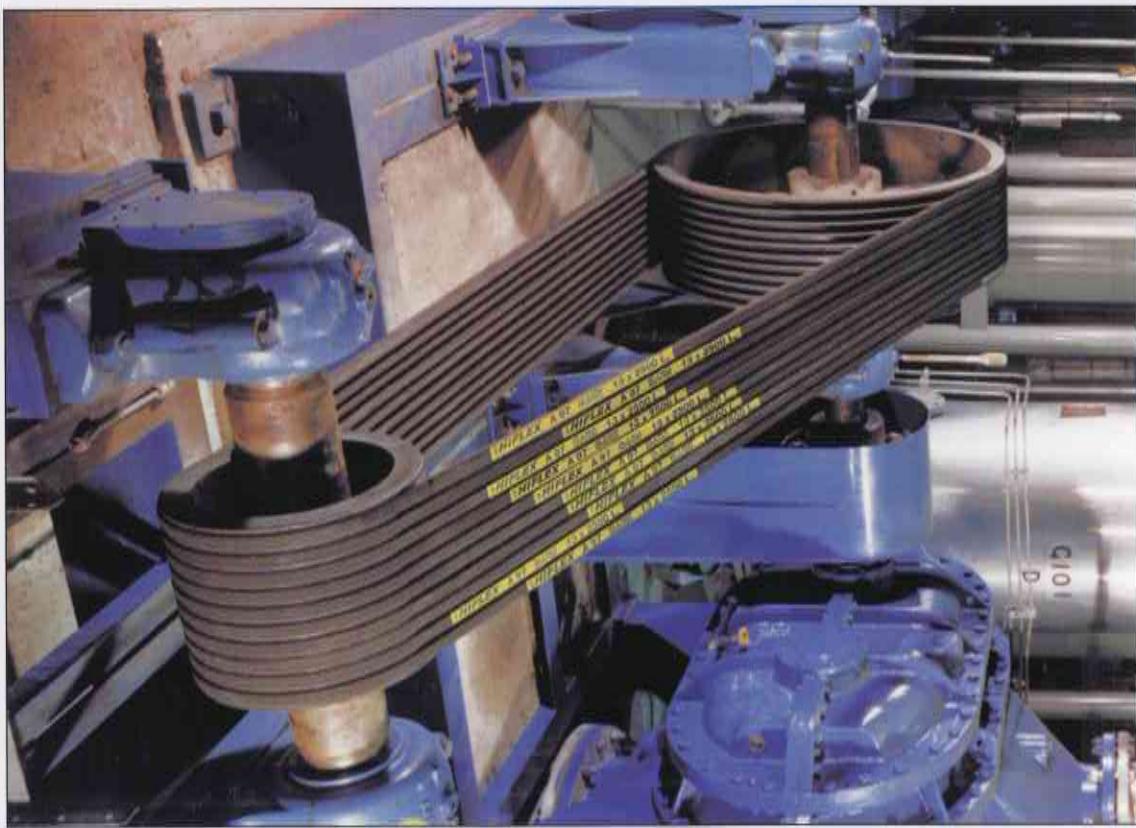

The wrapped type is the most common in industrial applications and is made up of a trapezoidal core of rubber, polyester tensile cords and is externally protected by an impregnated fabric cover which assures optimal abrasion resistance against the pulley and environment.

The Raw Edge Cogged type features a fabric cover on the upper side only, and a cogged inside section in order to allow the use on small diameter pulleys and has improved efficiency over the wrapped type V-belt.

Compliant to AS2784-2002, ISO 4184, DIN 2215/7753 and BS3790 standards, and compatible with RMA specifications, HIFLEX V-Belts have an operative temperature range of -30 to +80 degrees C. They are oil and heat resistant and assure smooth operation, high power transmission, shock absorption and long duration. HIFLEX V-belts are always manufactured, designed and marked with reference to the pitch length (l.p.).

In every mechanical sector you can find an application for the HIFLEX V-belt. Dunlop Hiflex is present worldwide and is your reliable and cost effective partner from the pre-sales technical support through to the post-sales service, for every need in the OEM or MRO field.

Banded, Poly-V, Double (Hex) and variable speed belts are also part of the HIFLEX range. Lengths and versions not included in the ranges mentioned are available upon request.
